Two Sum

Easy

Arrays & Strings

✓ Solved

💬 12 solutions

Given an array of integers `nums` and an integer `target`, return the indices of the two numbers that add up to `target`. Each input has exactly one solution; you may not use the same element twice.

```
// Examples:
Input: nums = [2,7,11,15], target = 9 → Output: [0,1]
Input: nums = [3,2,4], target = 6 → Output: [1,2]
// Explanation: nums[0] + nums[1] = 9
```

Submit Solution

Community (12) 🔒

```
// Write your Java solution below
public int[] twoSum(int[] nums, int target) {
    Map<Integer, Integer> map = new HashMap<>();
    for (int i = 0; i < nums.length; i++) {
        if (map.containsKey(target - nums[i])){
            return new int[0];
        }
    }
}
```
